Meet the Tesla of data moving technologies.

With an emphasis on spatial data, Safe Software's FME product is a powerful and cost effective Extract, Transform, Load (ETL) tool for business data automation.

Connect

Incompatible systems are a thing of the past, virtually any data can be connected with FME right out-of-the-box. FME allows you to move data between 300+ formats and applications, while preserving data quality throughout the conversion process.

Transform

Use raw data to meet any need. Mash up data, perform complex operations and output to any format or data store; however it's needed. Think of FME as your data Swiss Army knife that includes hundreds of transformers and tools that perform powerful data manipulation tasks all while giving you visibility into your data quality and processes.

The Day-To-Day

Typically Oil & Gas companies spend a lot of time dealing with data set challenges and trying to load IHS, drilling info or state and local government data sets in various systems.

This is where FME can help. Data managers now have a reliable data transformation strategy to alleviate Python scripts falling over or IHS schema changes wrecking data loads.

Automate

And rejoice! All FME workflows are reusable and can be configured to run automatically whenever new data is introduced or scheduled to run at a specific interval. And, with robust notifications and logging, you can quickly react and adjust accordingly. Powerful stuff.

FME gives you a proven system for advanced ETL, but also allows you to add valuable analyses to your data in the process.

For example, while spatializing data:

Why not look for patterns and add valuable attributes such as distance from the nearest pipeline or lease road?

Or create aggregate, de-normalized layers for quickly ascertaining competitor activity in an area?
